ECE6255A Term Project Instructions – Spring 2026

1. All registered students are required to participate and contribute in a term project, due April 17, 2026. Class is to be divided into groups to undertake the assigned project challenge. The group assignments will be posted on **canvas** course site. In terms of execution of project, proper documentation must be submitted along with the code and the results.
2. The term project assignment is designed for students to contribute, not just as a tool for the assessment of academic performance. Your work and submission must have your other classmates (beyond team members) as "user" in mind, meaning your contributions will be used and appreciated by others in class in the future.
3. Each group submission must include the following components:
   a. **Report**: A written report with explanations of approach, theoretical foundation if any, algorithmic design and the final results in terms of self-assessed performance metrics;
   b. **Code**: The set of source code that implements your solutions, instructions for use of the code system, and code running examples;
   c. **Presentation**: A presentation file that summarizes the overall project and provides highlights of Part a and b above in an easy-to-understand manner (including a video recording, see 5 below).
4. Students are encouraged to take advantage of online resources such as open source code that comes with permission to use. (No proprietary code shall be accepted.) However, the working details of any external code that is used must be thoroughly understood and explained in the project report and presentation. Grading of project will be carried out by the entire class, based on the clarity of project approach, soundness of solutions, accuracy of implementation (and code), ease of adaptation of the code for future use, and the overall presented learning value of the project.
5. Every group is required to make a *presentation* of their term project to the entire class. The presentation will be made via recorded videos of 12 minutes in length. All members of the group must take part in the presentation; all member presentations must be combined into a final video clip for submission. The presentation must include:
   - The relevant theory that forms the technical foundation of the assigned task;
   - A thorough explanation of the approach chosen for the task;
   - The implemented algorithms and the relevant source of implementation (e.g., self-implementation, open source implementation and websites, other sources, authorization or permission of use, etc.);
   - Performance evaluation report and analysis of results (as advice and insights for student's future use of code and system);
   - A demonstration of the *working* code/system.
